located at any specific spot. Instead, the appearance of a rainbow depends entirely upon the position of the observer in __28__ to the direction of light. In essence, a rainbow is an __29__ illusion.

Rainbows present a __30__ made up of seven colors in a specific order. In fact, school children in many English-speaking countries are taught to remember the name "Roy G. Biv" as an aid for remembering the colors of a rainbow and their order. "Roy G. Biv" __31__ for: red, orange, yellow, green, blue, indigo, and violet. The outer edge of the rainbow arc is red, while the inner edge is violet.

A rainbow is formed when light (generally sunlight) passes through water droplets __32__ in the atmosphere. The light waves change direction as they pass through the water droplets, resulting in two processes: reflection and *refraction* (折射). When light reflects off a water droplet, it simply __33__ back in the opposite direction from where it __34__. When light refracts, it takes a different direction. Some individuals refer to refracted light as "bent light waves." A rainbow is formed because white light enters the water droplet, where it bends in several different directions. When these bent light waves reach the other side of the water droplet, they reflect back out of the droplet instead of __35__ passing through the water. Since the white light is separated inside of the water, the refracted light appears as separate colors to the human eye.

A) bounces	I) permeates
B) completely	J) ponder
C) dispersion	K) preceding
D) eccentric	L) recklessly
E) hanging	M) relation
F) optical	N) spectrum
G) originates	O) stands
H) perceive
